

GASOK MVP Build Phase · GIWA Testnet Submission

GiwaGuard

Trusted work, verified on-chain.

An identity-aware, on-chain escrow marketplace for freelance work, built for GIWA, Upbit's Layer 2 for making Web3 accessible to everyone.

The problem

Freelance work runs on trust that doesn't scale, and Web3's fix has been too intimidating for most people to use.

1

No recourse when a client disappears

Freelancers deliver work and simply hope payment follows. Platforms mediate disputes at their own discretion, if at all.

2

Trust requires a middleman

Centralized marketplaces take a cut precisely because they're the only thing standing between two strangers and a bad deal.

3

Web3 tools intimidate mainstream users

Seed phrases, gas fees, and bridging are second nature to crypto natives, and a wall for everyone else.

The solution

GiwaGuard replaces the middleman with a smart contract. Every job's payment sits in escrow on GIWA until both sides agree it's done.

No platform fees. No third party holding funds. Just a client, a freelancer, and a contract that does exactly what it says.

If work is never delivered:

the client calls `refund()` and reclaims their ETH. Funds are never stuck.

Why GIWA

GiwaGuard is built around what makes GIWA different, not just deployed on it.

Accessibility mission

GIWA exists to remove Web3's friction for Upbit's mainstream user base. GiwaGuard's whole premise is trust without a steep learning curve.

Dojang trust layer

GIWA's EAS-based, Upbit-issued identity attestation.
GiwaGuardEscrow ships with a Dojang-ready verification hook from day one.

OP Stack scale

Low fees and fast blocks make small, everyday freelance payments practical, not just demo-sized transactions.

Bilingual by design

GIWA documents in Korean and English alike. GiwaGuard is built for that same mainstream-first audience.

Live on GIWA Sepolia

Deployed, verified, and running end to end, not a mockup.

GiwaGuard

• Built on GIWA · Identity-Verified Escrow

Trusted work, verified on-chain.

Every job is a smart contract. Every payment sits in ETH escrow until it's approved. Identity can be checked against GIWA's Dojang trust layer, with no platform fees and no middleman.

Architecture

Reused what worked, rebuilt what GIWA needed.

Frontend

Next.js + Tailwind CSS

Backend

viem + Supabase

Contracts

Solidity, built & tested with Foundry

Chain

GIWA Sepolia, OP Stack, Chain ID 91342

Identity, done honestly

GIWA's Dojang testnet registry address wasn't publicly available while building, so the contract ships with a real hook, not a fake one.

Today: MVP

- verifiedIdentity mapping in GiwaGuardEscrow.sol
- Admin-settable, on-chain, transparent
- isVerified() already used by the app's Identity tab

Next: Production

- isVerified() reads directly from GIWA's Dojang / EAS registry
- No other contract logic changes, same interface
- Real Upbit-issued KYC attestations, zero PII on-chain

Proof it works

Three real jobs, posted and funded live on GIWA Sepolia through the app.
